

Presto for DB/TextWorks

Advanced Web Publishing for DB/TextWorks

Presto for DB/TextWorks is a powerful and flexible new solution for publishing your DB/TextWorks textbases to the Web. Presto for DB/TextWorks allows you to continue to build and maintain your textbase in DB/TextWorks, but publish that content to the Web (Internet or intranets) via a limited version of Inmagic Presto. With Presto for DB/TextWorks, customers gain significant functionality that is either not available in DB/Text WebPublisher PRO (the traditional means of publishing a textbase to the Web) or would require extensive development or money to build in WebPublisher PRO. Some of the advanced capabilities found in Presto for DB/TextWorks include:

- Ability to search across all your textbases
- Robust homepages that make your knowledge repository exciting and inviting to users
- Alerts (push content to users for SDI applications) in both email and RSS formats
- Browsable directories that create easy-to-use information pathways to critical information
- InfoCart with email, save and print options
- Social features that can be turned off or on to enable comments, tags and ratings
- Events capturing, including usage and search statistics
- Many additional/optional features such as:
 - SharePoint integration
 - Federated search
 - Active Directory integration
 - Integration with third-party authentication systems, and more

Presto for DB/TextWorks vs. WebPublisher PRO: What's the Difference?

In addition to the advantages provided by the features listed previously, there are two key operational differences between Presto for DB/TextWorks and WebPublisher PRO:

- Presto for DB/TextWorks does not use the forms in DB/TextWorks to format data for Web display. Instead, it uses Web-based designs in Presto to enable easy creation of Web pages for DB/TextWorks content.
- Presto is based on MS-SQL and always requires a copy of MS-SQL to be installed.

How Presto for DB/TextWorks...Works

Presto for DB/TextWorks is a version of Presto that is specifically designed to publish content from DB/TextWorks textbases. It has all of the capabilities of Inmagic Presto – including the Presto homepage, search, security, social tagging, commenting and rating – but instead of managing content within the application, textbases are managed in DB/TextWorks and content is synchronized to Presto via the Presto TextWorks connector. After the initial set-up, the connector synchronizes new, modified and even deleted content in your textbases with Presto. The connector can use DB/Text WebPublisher PRO or the free WebPub Runtime application to enable Presto for DB/TextWorks to communicate and synchronize with your DB/TextWorks textbases.

Features that operate on external content (or that support integration to external applications) are considered options and are available for an additional fee. Optional components include SharePoint integration, federated search, blogs and forums, API, Active Directory single sign-on, and more.

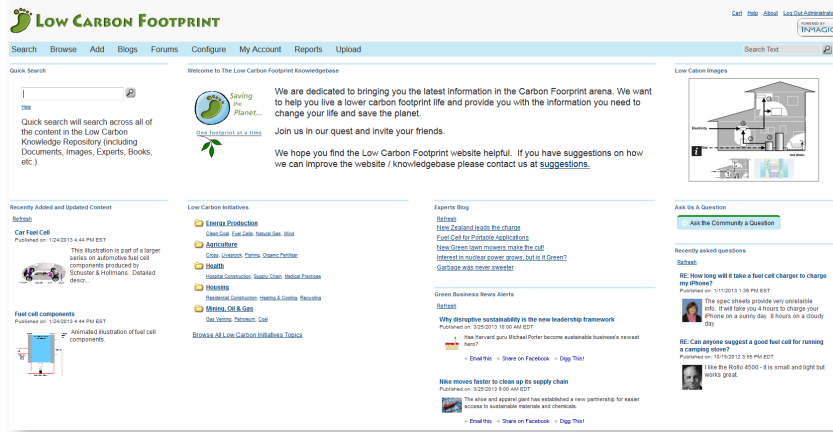

About Presto

Presto is a knowledge management platform that helps organizations capture, access and distribute information to improve effectiveness. Presto represents a fundamentally new approach to information and knowledge management, enabling a true 360-degree view of your organization's knowledge and allowing you to easily:

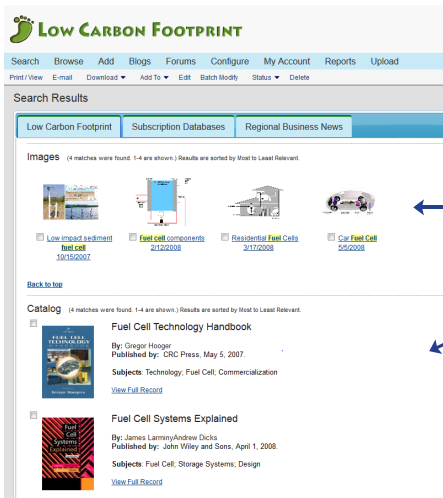

- Consolidate heterogeneous information into a single repository;
- Search both internal (e.g., corporate IP) as well as external (e.g., subscription databases) information at the same time;
- Proactively publish top-down vetted information;
- Leverage the "wisdom of the community" to enhance corporate knowledge via bottom-up social capabilities; and
- Perform information discovery via search, browsable directories or alerts.

The result is a powerful platform capable of addressing an organization's most important knowledge and information management needs.

If you are looking for the next generation of Web publishing capabilities for your DB/TextWorks textbases – and want to avoid costly programming – Presto for DB/TextWorks is your solution.

Build homepages that will dazzle your users and keep them coming back for more.

Search across two or more textbases at the same time.

Allow the search results for each textbase (documents, books, images, etc.) to be formatted so that the content shines.

Results for Image textbase.

Results for Books textbase.
